Linkable Interactive Visualization Exploration (LIVE) Environments

What is LIVE?

LIVE lets anyone build "Linkable Interactive Visualization and Exploration" Environments.

LIVE is free, open-source, and helps with shared data and visualization challenges across astronomy (LIVE Astro), biology (LIVE Bio) and GIS (LIVE GIS).

As LIVE's infrastructure is being built, collaborators are ensuring its utility across Astronomy, Biology, and GIS by pursuing LIVE's science demonstration projects.

LIVE Astro

LIVE Bio

LIVE GIS

LIVE Astro

glue

python library to explore relationships within and between related datasets

Jdaviz

GUI-based tools link data visualization and interactive analysis (based on glue & Jupyter).

OpenSpace

interactive data visualization software designed to visualize the entire known universe.

WorldWide Telescope

a tool for showcasing astronomical data and knowledge

astroPy

A community effort to develop a **common core package** for Astronomy in Python and foster an ecosystem of **interoperable astronomy packages**

ESA Sky

allows visualization and download public astronomical data (cf. Aladin)

Tools & Integrations (Requested & Planned)

+ More Tools & Integrations useful in Astronomy & Beyond (Requested & Planned)

Leaders of several well-used astronomical tools and toolkits are eager to integrate their projects with LIVE Astro. (For reference, prototype plug-ins for the Aladin and yt services below already exist for glue, and discussions of MAST integration with LIVE Astro would be an expansion of the Jdaviz environment built by NASA for the James Webb Space Telescope Mission, using glue. The CARTA project is of special interest, in that it could serve to bring the "radio" astronomy community into better communication with shorter-wavelength-focused colleagues more reliant on MAST-based tools).

CARTA

Cube Analysis and Rendering Tool for Astronomy image visualization and analysis tool designed for the ALMA, the VLA, & SKA

Aladin Lite

lightweight version of the Aladin tool, running in the browser and geared towards simple visualization of a sky region

MAST

The Mikulski Archive for Space Telescopes is an astronomical data archive focused on the optical, ultraviolet, and near-infrared

Astro Data Lab

The overall goal of Astro Data Lab is to enable efficient exploration and analysis of the large datasets now being generated by instruments on NOIRLab and other wide-field telescope

TOPCAT

does what you want with tables

js9

brings astronomical image display to your browser and desktop

vaex

python library for lazy out-of-core DataFrames (similar to Pandas), to visualize and explore big tabular datasets

K3D

Jupyter Notebook 3D visualization package.

A 3D visualization tool designed with native interoperation with existing powerful libraries such as **PyVista**, without being strictly dependent on them.

yt

python package for analyzing and visualizing volumetric data

And more... stay tuned!

Creating an Intensity vs. Time and Frequency vs. Time Data Sonification Tool for Glue

Joe Bradley, Harvard College
 Advisor: Dr. Kimberly Arcand

Abstract

With almost all of observational astronomy and astrophysics being concerned with light-based phenomena, it follows that most data representations in the field are visual. That said, it is beneficial to contribute to a multi-sensory framework for data analysis. I sought, with the help of Dr. Kimberly Arcand, to supplement the data visualization software Glue with a tool that allows the user to create sonifications – that is, a meaningful data representation through sound – of their astrophysical data. This plug-in takes as input data in the intensity vs. time domain or frequency intensity vs. time domain and outputs an audio file that re-contextualizes the information typically identified visually (as part of a plot or diagram). The tool operates using many user inputs to specify the nature of the sonification – all of which are integrated into the pre-established operations of the Glue software. Multiple Python packages for data sonification already exist; I synthesized and brought together multiple complementary functions in Python to allow for a plug-in that can be pragmatic and widely useful for astrophysics data analysts. This sonification capability will be adapted for the Pulsar Science Collaboratory, which is looking to allow its crowd-sourced pulsar identification initiative to expand to those with visual impairments.

(a) sonification

(b) sonification

December 2024 Junior Tutorial paper by Harvard student Joe Bradley, supervised by Kim Arcand.

Fig. 4.—: Pulse and dispersion measure plots and sonifications for pulsar ID: 2046314 (the same unlikely pulsar from Fig. 2)

TEMPO NO₂ Data

TEMPO, a collaboration between the Smithsonian and NASA, is the first space-based probe to measure air pollution hourly over North America at neighborhood scales. NO₂ (nitrogen dioxide) is one of the pollutants detected by TEMPO. It is produced by wildfires and the burning of fossil fuels. NO₂ contributes to the formation of harmful ground-level ozone and toxic particulates in the air we breathe.
